Abstract

The article is devoted to the territorial as well as the class and professional disproportions, observed in the dynamics of employment in Bulgaria for the period 2007-2010. Adopting an untraditional research approach there has been made a comparative analysis and assessment of the impact, which the uneven distribution of the employed by statistical regions and classes of professions has on the structure of the labour market in this country. The study has allowed the identification of certain principal trends in the dynamics of employment in this country for the period under study, as well as the establishment of the extent of negative influence of the global economic crisis on the demand for labour in the country.
